

GoFly Project V4/Pico Outsider

Installing/upgrading “flying apps”

Document rev: 16.06.2015

This short document contains information about installation, upgrading, folders structure and folders content.

LK8000 has different approach in this matter than XCsoar/TopHat apps.

At this moment, there is no multiboot option to have all apps installed on one device at the same time. App installation takes over main place on the device. Settings are not overwritten. Installing LK8000 over XCsoar, or XCsoar over LK8000 will keep the settings folders in place.

All flying apps (LK8000/XCsoar/TopHat) use the same hardware setting for external serial device (Pico Insider/Outsider) which provides precision GPS/baro data and acoustic vario in real time.

External sound under LK8000 Device configuration page with work only if folder “_Configuration” contains SOUND_TABLE.TXT file. (follow up next pages for more details).

Look for...

LK8000 sound table file at:

<http://www.goflyinstruments.com/download-3/>

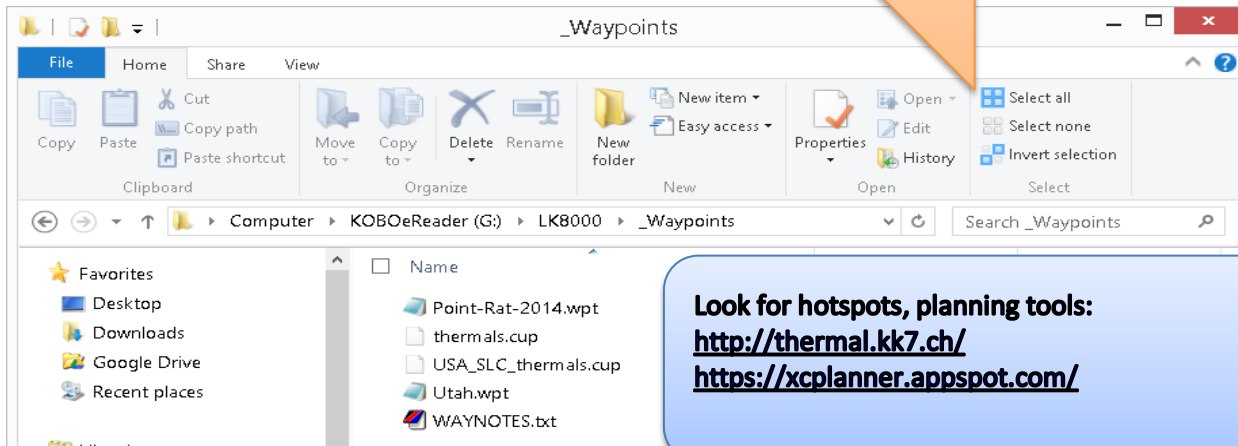

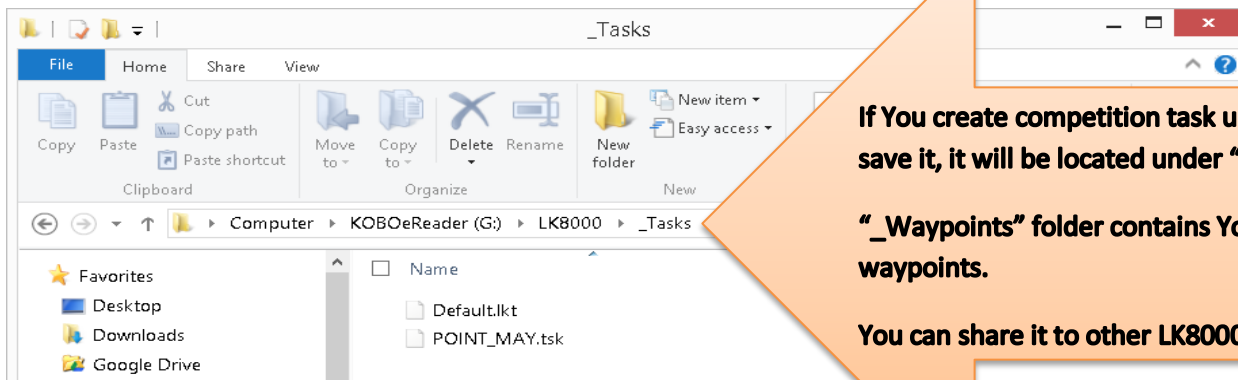

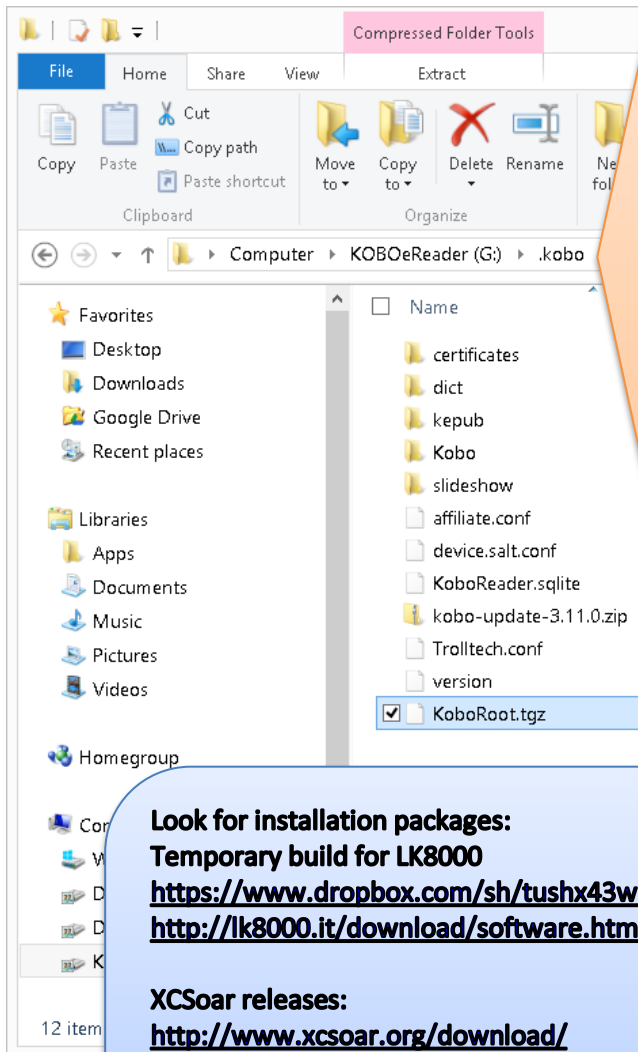

Look for online contest servers at:

<http://www.xcontest.org/world/en/>

http://www.paraglidingforum.com/leonardo/page/index_full

and many more, global or local websites...

“.kobo” folder (hidden by default under MAC computers) is a system folder that we use to install or upgrade LK8000/XCsoar/TopHatSoaring apps.

Always make sure Your Kobo is up to date before installing flying apps. Connect Kobo at least once to WiFi and Kobo will check with online servers if it has newest firmware. This is automatic process and takes 10-30minutes. Progress bar and information on the display will keep You informed about this process.

Download KoboRoot.tgz file (installation package), make sure Your browser didn't automatically unpack it. It has to stay in TGZ format. This is the only way Kobo will recognize installation package and perform installation/update process.

Just copy KoboRoot.tgz file into “.kobo”folder, and safely disconnect/unmount Kobo from PC. Then unplug USB cable and wait a minute. Kobo will perform installation or update process and after that will restart with flying app on the screen.

Look for installation packages:

Temporary build for LK8000
